🛠 Git Backup Guide

This guide summarizes our session for backing up J001-J010 to your external HDD.

1. Repository Setup & Branching

Command	Description
git init -b main	Initialize a new Git repo with main as the default branch.
git branch -m main	Rename your current branch to main if it defaulted to master.
git status	Check which files are ready to be saved or are currently ignored.

2. Keeping it Clean (.gitignore)

Command	Description
echo "*.class" >> .gitignore	Create a rule to ignore all compiled Java .class files.
cat .gitignore	View your ignore rules to ensure they are correct.

3. The Local Workflow (Save Your Progress)

Run these in your ~/My_Learning folder to create a save point.

1. **Stage:** git add . (Prepares all files and the Java/ folder structure).
2. **Commit:** git commit -m "Add Java practice J001-J010" (Saves the snapshot).
3. **Log:** git log --oneline (Shows your history of save points).

4. External HDD Backup

Commands to sync your project to /media/ronin/HDD/GitBackup/.

- **Initialize (on HDD):** git init --bare (Run this inside your HDD folder first).
- **Link HDD:** git remote add hdd-backup /media/ronin/HDD/GitBackup/My_Learning.git (Creates the "hdd-backup" nickname).
- **Sync:** git push hdd-backup main (Uploads your code to the drive).
- **Verify:** git ls-tree -r hdd-backup/main --name-only (Checks the files safely stored on the HDD).

Pro-Tip: To Restore Everything

If you ever need to get these files back on a new computer, plug in your HDD and run:
git clone /media/ronin/HDD/GitBackup/My_Learning.git
